

pyHMT2D: Python-based two-dimensional hydraulic modeling tools

Xiaofeng Liu^{*1}

¹ Department of Civil and Environmental Engineering, Institute of Computational and Data Sciences, The Pennsylvania State University

Summary

Flooding Two-dimensional (2D) hydraulic modeling, replacing one-dimensional (1D) modeling, has become the work horse for most engineering purposes in practice. Many agencies, such as U.S. DOT, Bureau of Reclamation (USBR), FEMA, and U.S. Army Corp of Engineers (USACE), have developed and promoted 2D hydraulic models to fulfill their respective missions. Example 2D models are SRH-2D (USBR) and HEC-RAS 2D (USACE).

SWEs are the backbone of most flood simulation models (Liu et al., 2008).

Statement of need

Functionality

Basic Functionality

Advanced Functionality

Dependencies

pyHMT2D relies on functionality from the following Python packages: GDAL (GDAL/OGR contributors, 2020), NumPy (Harris et al., 2020), Matplotlib (Hunter, 2007).

Acknowledgements

I thank Dr. Yong Lai at U.S. Bureau of Reclamation and Scott Hogan at U.S. Federal Highway Administration for their valuable knowledge and suggestions regarding SRH-2D. I also thank Gary Brunner from U.S. Army Corps of Engineers for his time answering my questions regarding HEC-RAS.

pyHMT2D was developed as a tool box for several past and ongoing research projects in our group. Though pyHMT2D did not directly receive financial support from these projects nor it is in the workscope, pyHMT2D did benefit from the knowledge on various aspects of 2D hydraulic models accumulated through these projects.
